I practice empathic leadership and enable my teams to achieve great outcomes for our users and the business through a culture of collaboration and transparency.

Work Experience

(2023 - current) Staff Engineer, Maersk, Energy Transition Platform
Paris, France

I joined in 2023 to consult for 7 months on setting up an elixir platform, and to train our first hires on TDD, CI/CD, infra, devops best practices. In those seven months I found time to coach our engineering managers (who were new to their role), and also to build and launch our first products.

By 2024, my contract had been extended another year, and we were given the mission to invest further. I led hiring, interviewing the next batches of new hires, before eventually coaching others to run our interview gauntlet. During this time I built our first digital twins for visualizing real-time vessel emissions, powered by hundreds of millions of data points we measure daily.

In 2025, my efforts were recognized by making my role permanent. We are now tackling really large problems that span several engineering orgs, such as building support for lower-emissions fuels in critical systems, and optimizing our fuel purchasing. I'm proud that we deploy to production 30+ times per day, have 99.999% uptime, and have very happy internal users. No two days are alike, and I love it.

(2022 - 2023) Senior Engineer II, BackMarket
Paris, France

After eight years in the management track, I've decided to get my hands dirty again and ship code. BackMarket has many technical challenges and I find myself best placed to solve them by being in the trenches so that I can influence engineers directly.

Returning to an engineering role has been a delight for me, and it feels good to once again have my hands on the code, and to be in the trenches with my fellow engineers.

(2021 - 2022) Acting Head of Engineering, BackMarket
Paris, France

I led several engineering teams that power the public-facing experience at BackMarket

- Grew one team of 8 engineers up to 18 engineers spanning 3 teams
- Coached engineers leading cross-company efforts to modernize our tech stack
- Led company-wide effort to revamp website structure and minimize SEO impact
- Paired with engineers to advocate for pair programming and knowledge sharing

(2020 - 2021) Senior Engineering Manager, VMware
Paris, France

I led our team in Europe through the transition of Pivotal Software's acquisition by VMware.

- Increased number of courses taught by 400%
- Ran coding workshops for 1000+ customer engineers across 50 countries
- Launched a network of external partners to deliver Kubernetes training courses

(2018 - 2020) Director of Engineering, Pivotal Software
Paris, France

I took on the opportunity to lead our education services in Europe, with a role that touched upon nearly all aspects of the business and delivery.

- Hired and mentored teams of engineers and instructors across Europe
- Partnered with sales and services leadership to build a pipeline of customers
- Created new workshops to further expand the reach of our business

2015 - 2018 Engineering Manager - Pivotal Software
(Paris, France)

After my earlier success as a technical leader, I was promoted to manager and responsible for mentoring engineers, designers and product managers across multiple teams. I was our first manager in our Paris office and established our presence in France.

- Mentored 40+ engineers, designers and product managers over three years
- Grew 10+ of my direct reports to take on leadership roles
- Led hiring for engineers in France, interviewing 200+ candidates
- Architected and implemented applications for customers across Europe

2013 - 2015 Engineer - Pivotal Labs
San Francisco, California

I joined as a generalist software engineer, and rapidly found myself taking on more responsibility. Worked with clients as small as two founders up to 80+ person teams from all major industries (e-Commerce, Banking, Aviation, Automotive). Launched new products while teaching agile methodologies.

- Led app development teams as large as 80+ contributors
- Coached and mentored colleagues and customers to take on leadership roles
- Delivered cleanly architected applications using TDD and CI/CD
- Built internal tools to speed up development and solve unique problems
- Trained dozens of R&D and partner engineers on best practices
- Contributed to open source tools used by thousands of engineers

- Built open source tools to meet emerging needs (TDD for objc, swift and go lang)

(2011 - 2013) Engineer - Nearbuy Systems
Menlo Park, California

Nearbuy was a software startup aiming to help Brick and Mortar retailers facing disruption from Amazon and e-Commerce competitors. As an engineer, I led efforts to build new in-store experiences and grow the business by onboarding new customers.

- Migrated time-series data from Postgres to Cassandra to scale our database
- Researched and implemented “shopper-tracking” vision systems in C++
- Built large-scale multi-tenant multi-vendor presence tracking systems on AWS
- Built full-stack customer facing functionality in Ruby on Rails, CSS, Javascript

2009 - 2011 QA Automation Engineer - Apple
Cupertino, California

Worked with two separate teams to build out automation to verify our software could integrate daily into company-wide software builds. Worked directly with engineers, management, design and program management to determine where to focus my testing efforts. Met a lot of great people, learned a lot about Agility, and learned an awful lot about managing humans.

- Wrote and maintained a suite of automation to test for regressions
- Operated the internal wiki server used by tens of thousands of Apple employees worldwide, keeping it patched, running upgrades, debugging performance issues
- Discovered, investigated, and triaged bugs in daily new builds

Highly skilled in the following areas

Test-Driven Development (TDD), Functional Programming, Elixir, Erlang and OTP, Object-Oriented (OO) Design, Domain-Driven Design (DDD), Ruby, Golang, Objective-C, Swift, Kotlin, javascript, typescript, elm, angular js, Behavior-Driven Development (BDD), Java, kotlin., Kubernetes, AWS, Google Cloud, Azure, nginx, bash, zsh, fish, Python, Objective-C, go lang, coaching, facilitation, nix, Evolutionary Architecture, continuous integration, CI / CD, load testing, DevOps, infrastructure as code (IaC), error tracking, observability, SQL, R, Data Science, data validation, leadership, mentorship, communication, presentation, statistics, roadmap creation, user story writing, story acceptance, terraform, machine-learning, agents, agentic programming, claude code

Languages Spoken

- English (native)
- French (fluent, C1 level)
